## CHILD HEART FOUNDATION

### Empowering Frontline Workers

On July 1st, our team successfully conducted a CHD awareness session at Anangpur PHC in Faridabad, targeting frontline health workers. **We trained 30 ASHA workers and ANMs**, equipping them with essential knowledge about CHD. By empowering them to become vital advocates for early detection and intervention within their communities, these dedicated healthcare professionals serve as a bridge between underserved populations and vital healthcare services.

### Collaborations with PHCs

On July 18th, our team engaged with Medical Officers (MOs) from six PHCs during a Block Level Review Meeting at CHC Farukhnagar, Gurugram. We presented a comprehensive overview of the critical need for CHD awareness programs targeting frontline healthcare workers. Building on this momentum, the CHF team aims at conducting awareness sessions in these PHCs over the coming months, empowering more ASHAs and ANMs to identify and address CHD cases within their communities.

**July 2024**

# REACHING CHILDREN IN UNDERSERVED AREAS

On July 6th, our team conducted a medical camp in the underserved Daryaganj area of Old Delhi, focused on the early detection of Congenital Heart Disease (CHD).

The camp **screened 120 children**, resulting in the **identification of 7 children with potential CHD**.

These children have been referred to the CHF Delhi Centre for further evaluation and diagnosis. Our ongoing medical camp initiatives in underprivileged regions are instrumental in identifying children at risk and facilitating timely interventions. Through such initiatives, we are leaving no stone unturned and ensuring no child with CHD is left behind.

## EXPANDING EFFORTS IN EAST DELHI

Our team conducted the second medical camp of the month of July in the underserved community of Maupur, East Delhi, on July 27. **More than 180 children were screened for congenital heart disease**. Through these screenings, **we identified 3 children** with potential CHD, who were promptly referred for further evaluation and treatment.

By identifying potential CHD cases early, we can significantly improve outcomes. We will continue to strive for early detection and comprehensive care for children with congenital heart disease through expanded screening initiatives and collaborative partnerships.
